Firstly, thanks for the author reply. I agree with the authors. However, I still have a comment for this paper.

In Figure 1, we can find that not only a good correspondence between HU_H and M" during the period 23-29 June, but also the average of the HU_H values increase clearly during 26/6-25/8. Is it also cause by the daily sum of the Kp index? If it is I would suggest the author to show the increase of the daily sum of the Kp index values.
