Thank you for the comments about the paper. They have been very helpful and we think that they can be used to improve our article.

First, we will try to answer the basic questions that, as we understand it, are similar in both referees, namely, a) why we use lightning data for the rain estimates and b) how significant is the use of precipitation data collected in one point to estimate the rain in the rest of the observational area.

C2735

Second, we will answer the comments affecting the formal questions, and make some change suggestions.

All this is in the pdf document in the supplement.

Please also note the supplement to this comment:
