Firstly I would like to thanks for your useful comments to improve the document.

For better understandig, please find attached a table linking your comments and how we have addressed all of them.

In addition please find attached the figures and final version of the paper after the review.

Please also note the supplement to this comment:
Data interoperability software solution for emergency reaction in the Europe Union

Referee 1

Comment

After reading the scenario used for the validation, it seems that information flow in an operational usage scenario is unidirectional: Once configured the system, it allows the stakeholders to view all information, but not take actions (these have to be taken using the local EMSs). This is probably a work in progress, but should be discussed at the end.

Action

DISASTER software architecture allows bidirectional communication. An explanation of this feature has been added to the Conclusion section.

A top level graphical view of the different components of the ontology may facilitate its understanding.

We have included a top level graphical view of the EMERGEL (Figure 2).

Similarly, a top level of the technical architecture (by detailing the information presented in Fig. 1) would be very useful.

We have included a top level graphical view of the DISASTER architecture (Figure 4) and its explanation in Section 4.

Information in Section 5.3 from page 6022 (line 10) to Section 6 title should be placed in Section 5.3.

We have included minor changes in the organization of Section 5.
